The present sequence represents the amino acid sequence of a yeast translation termination modulation protein related peptide. Note: this sequence appears in the sequence listing but no reference is made to it in the main body of the specification.
                   The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acid sequences fully defined in the specification. The probe is a single exon probe tha hybridises under high stringency conditions to a nucleic acid molecule expressed in human cells or tissues. Also included are a spatially-addressable set of single exon nucleic acid probes for measuring human gene expression (comprising a plurality of single exon nucleic acid probes cited above, where each of the plurality of probes is separately and addressably isolatable or amplifiable from the plurality), a single exon microarray for measuring human gene expression, a method of measuring human gene expression, a method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human genome derived single exon protein #4394
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         29-JUL-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ABO58160 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gene expression analysis, for a splicing events, for assessing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative

The probe, methods and apparatus are useful in gene CC cited above. The probe, methods and apparatus are useful in gene CC cited above. The probe, methods and apparatus are useful in gene CC cited above. The probes may be used as tools for surveying CC tissues to detect the presence of expressed messages that contain their specific exon, or in constructing genome-derived single exon microarrays. CC in addition, the probes are used in identifying and characterising consistentials are used in identifying and characterising consistentials in the genomic locus that includes thair exon, in assessing calternative splicing events, in detecting and characterising gross calterations in the genomic locus that includes thair exon, in assessing smaller genomic alterations, in priming the synthesis of nucleic acids, or in expressing the ORP-encoded peptide. The present sequence is a human contained that contain the probe protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was contained to the property of the printed specification, but was contained to the property of the printed specification at the contained the contai
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
```

The invention relates to Pseudomonas aeruginosa polypeptides and the polymucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a bacterial infection, for evaluating a compound, such as a polypeptide, for the ability to bind a P. aeruginosa nucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa drugs, as templates or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa-caused infection, and in detection of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences ABO67826

aeruginosa polypeptides

of the

Note: The

Novel isolated nucleic acid encoding Pseudomonas aeruginosa polypeptide, useful as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from bacterial infection.

Also described are: a recombinant expression vector comprising the nucleic acid permally linked to a transcription regulatory element; and a cell comprising the recombinant expression vector. The nucleic acid is useful for preparing a vaccine composition against Klebsiella pneumoniae. This is the amino acid sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at

                                                                                                                      The invention describes a complex of protein-protein interactions in Helicobacter pylori selected from 421 complexes given in the specification. The complex of protein-protein interactions are useful for screening for agents which modulate the interaction of proteins. Modulating compounds which binds to a targeted bacterial protein may be used for treating or preventing ulcers in a human or animal. This is the amino acid sequence of a selected interacting domain (SID), identified at the top of the pages in the specification has obscured areas of protein sequence, the indexer has replaced the residue with an X to represent an illegible residue
                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-MAY-2003

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

SUBCELLULAR LOCATION: Integral membrane protein (By similarity)
SIMILARITY: Belongs to the binding-protein-dependent transport
System permease family.

The method is useful for identifying compositions or agents which increase nonsense suppression. The invention may also be used for antiviral therapy and for suppression of pathological nonsense mutations. The present sequence is Saccharomyces cerevisiae motif peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Von Willebrand Disease; Osteogenesis Imperfecta; Breast Cancer; Ovarian Cancer; Wilms Tumour; Hirschsprung disease; Cystic fibrosis; Kidney Stone; Familial hypercholesterolaemia; Retinits Bigmentosa; Neurofibromatosis; Retinoblastoma; ATM; Costmann Disease; yeast.

```
the RNA helicase MTTI with a composition or agent under conditions
CC permitting binding between the MTTI and the composition, detecting
CC specific binding of the test composition or agent to the MTTI. The
CC composition and methods are useful for modulating the fidelity of
CC translation termination or for identifying agents that: affect the
CC translation activity of mRNAs by altering frameshift frequency, permit
CC transcripts, and provide modulators (inhibitors/stimmation of aberrant
CC transferase activity during initiation, elongation, termination and mRNA
CC degradation of translation. The agents, which may be antagonists or
CC gonists, are useful in screening, disgnostic and therapeutic purposes,
CC for diseases or conditions resulting from or cause premature translation,
CC such as beta-thalassaemia, beta-globin, Duchemne/Becker Muscular
CC Dystrophy, Haemophilia A, Haemophilia B, Von Willebrand Disease,
CC Osteogenesis Imperfecta, Breast cancer, Ovarian Cancer, Wilms Tumour,
CC Hirschsprung disease, Cystic fibrosis, Kidney Stones, Familial
CC hypercholesterolaemia, Retinitis Pigmentosa, or Neurofibromatosis,
CC the amino acid sequence of the yeast translation termination modulation
CC protein motif vr
Identifying a test composition or agent that modulates the efficiency translation termination comprises contacting the MTTI with the test composition or agent, and determining if the test composition or agent inhibits the MTTI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peltz S,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC transferase activity, especially diseases resulting from a nonsense or CC frameshift mutation e.g. beta-thalassemia, beta-globin, Duchene/Becker CC Muscular Dystrophy etc. It can be used to identify disease conditions CC involving a defect in the complex, by transfecting cells with encoding CC nucleic acid and determining the proportion of defective complex before and after transferase activity during translation, inhibiting the peptidyl transferase activity during translation, inhibiting the CC interaction between MTI and eRR3 or involved in enhancing translation termination. Vectors comprising polynucleotides encoding the complex (or contisense sequences) can be constructed and introduced into cells to interfere with complex expression and so modulate the efficiency of cranslation termination of mRNA and/or degradation of aberrant CC transcripts in a cell. Agents binding to the complex can be identified can included in therapeutic compositions useful as above, and/or used to modulate peptidyl transferase activity during translation in cells. They are also useful to modulate the efficiency of translation of aberrant CC transcripts in cells. The method can be useful to identify agents of compositions modulating binding to MTTI, useful to identify genes.

CC sequences AAY77804-812 represent motifs I-IX comprised in the genes of othersers usef for modulating translation to reministion the genes of othersers usef for modulating translation to identify genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The gene encoding Helicase B (HCSB; renamed MTT1, for Modulator of Translation Termination) and the conserved proteins known to interact and carry out translation termination in eukaryotic cells, peptidyl eukaryotic release factor (eRF) 1 and eRF3. The complex can be used to modulate peptidyl transferase activity during translation in a cell. It can be administered therapeutically combined with a carrier in pharmaceutical compositions to treat diseases associated with peptidyl pharmaceutical compositions to treat diseases associated with peptidyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New multiprotein complex which can modulate peptidyl transferase activity during translation, useful to treat diseases associated with peptidyl transferase activity e.g. Duchene/Becker Muscular Dystrophy.

                                                                                                                                                                                              RESULT 5
                                                                                                                                                                                                                                                                                         S
                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               termination. Vectors comprising polynucleotides encoding the complex (or antisense sequences) can be constructed and introduced into cells to interfere with complex expression and so modulate the efficiency of translation termination of mRNA and/or degradation of aberrant and included in therapeutic compositions useful as above, and/or used to modulate peptidyl transferase activity during translation in cells. They are also useful to modulate the efficiency of translation of aberrant transcripts in cells. The method can be used to identify agents/
compositions modulating binding to MTT1, useful to identify agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Muscular Dystrophy etc. It can be used to identify disease conditions involving a defect in the complex, by transfecting cells with encoding nucleic acid and determining the proportion of defective complex before and after transfection. It is also useful to screen for drugs involved i peptidyl transferase activity during translation, inhabiting the interaction between MTT1 and eRF3 or involved in chancing translation interaction between MTT1 and eRF3 or involved.
                                                                          15-JAN-2004
                                                                                                                 ABW01201;
                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       pharmaceutical compositions to treat diseases associated with peptidyl transferase activity, especially diseases resulting from a nonsense or frameshift mutation e.g. beta-thalassemia, beta-globin, Duchene/Becker Muscular Dystrophy etc. It can be used to identify disease conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    carry out translation termination in eukaryotic cells, peptidyl eukaryotic release factor (eRP) 1 and eRP3. The complex can be used to modulate peptidyl transferase activity during translation in a cell. It can be administered therapeutically combined with a carrier in
                                                                                                                                                       ABW01201 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequences AAY77813-817 represent protein fragments
